What the current evidence says

RGB MS-SSIM at matched complete-file rate. Higher is better; rates include headers and quantization-table segments.

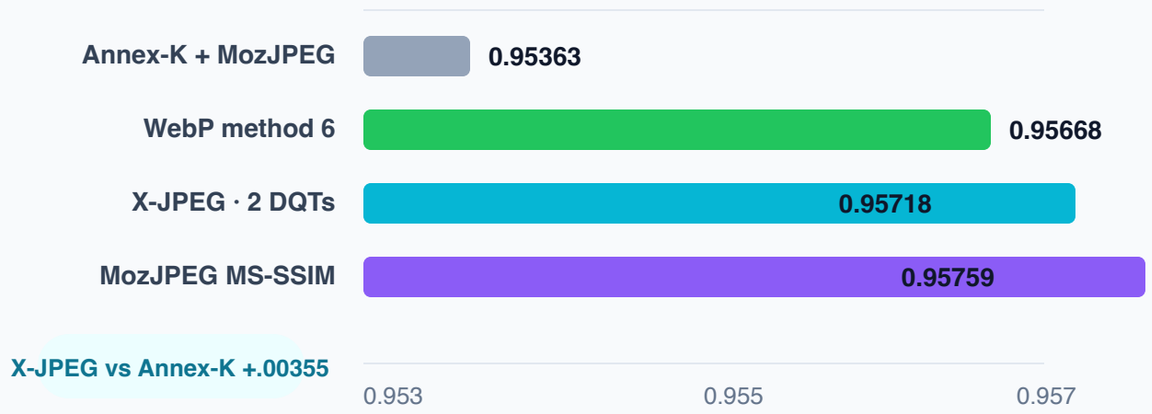

A · High-power adaptivity study · COCO val2017 · n = 1,000 · 256×256 · ≈0.8 bpp

The three-DQT model is the clean test of image/table assignment; controls receive one dataset-wide rate scale.

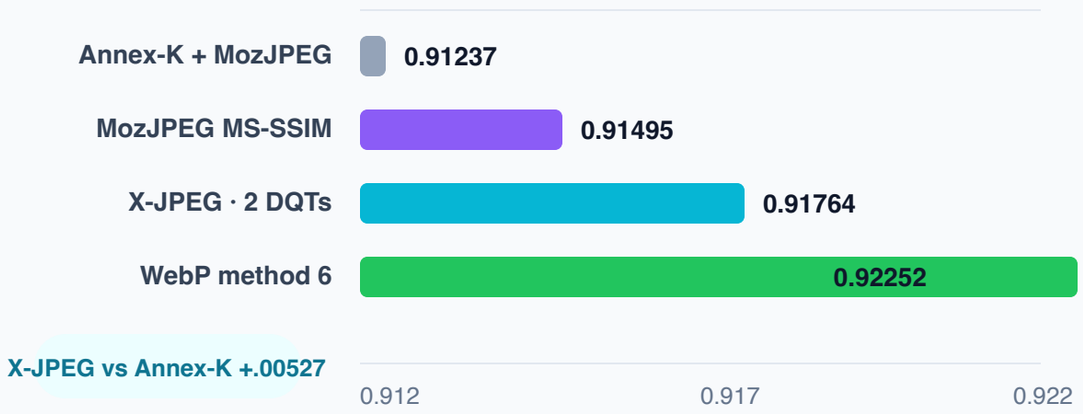

B · 0.5 bpp pilot · n = 100 · native

MozJPEG backend, progressive 4:2:0

C · 0.25 bpp pilot · n = 100 · native

Extremely low rate; WebP is strongest in this test

Low-rate panels are exploratory aggregates without paired confidence intervals; they motivate a larger preregistered benchmark, not a universal codec-ranking claim.
